

# JASON DEVANEY

FORAGES AND SMALL GRAIN PRODUCT MANAGER

jasondevaney@mustangseeds.com

Jason DeVaney has an extensive background in agriculture and small grains. His experience includes warehouse manager, sales agronomist and soybean production manager. As a sales agronomist, Jason gained valuable experience of being in the fields with the customer and he takes great pride in learning about the different soil types, soil health and the products that will work best for each individual operation. Along with every producer, Coyote Seeds fully intends to continue to provide excellent customer service along with top quality products for your farms.

### **AL LENHART** FORAGE SPECIALIST/DISTRICT SALES MANAGER allenhart@mustangseeds.com | 605.951.8552

Al Lenhart has been a Forage Specialist and District Sales Manager since 2021. His territory covers southern Minnesota and northern Iowa. Al graduated from South Dakota State University with a degree in Agriculture Science with experience as a seed and research specialist. Al is committed to returning the investment of time that many crop farmers, hay growers and members of the dairy industry invsted in him by giving back and helping growers generate profitability.

# DAVE STEPHENSON

DISTRICT SALES MANAGER

davestephenson@mustangseeds.com | 605.480.1046

Dave Stephenson has been a District Sales Manager at Coyote Seeds/Mustang Seeds since 2012. Dave began working almost entirely with Coyote Seeds in 2014. His territory covers the southern part of South Dakota, Nebraska and Iowa and he works with over 60 dealers. Dave graduated from the University of Kentucky with a BS degree in Agronomy/ Ag Production. Before coming to Mustang Seeds he gained valuable experience working in the Coop system. Dave enjoys working for a family owned business and he feels our service is a huge advantage as we can quickly adjust to the changing needs of our farmers, customers and dealers.

Coyote Seeds has been a premiere field seed provider since the early 1940's. The company was and is most well known for its Coyote 990 Alfalfa, which is a very winter hardy Midwestern blend alfalfa that has performed for farmers and ranchers for decades.

Coyote Seeds is sold by retailers throughout Iowa, Nebraska, South Dakota, North Dakota, and Minnesota. It has provided growers different options in field seeds at competitive prices for decades. The quality seed that Coyote offers is also grown in this region and is well adapted to handle the Midwestern hot dry summers and cold winters.

Coyote Seeds from its inception until 2008 was distributed out of Bridgewater, South Dakota. In 2008 Coyote was purchased by Mustang Seeds Inc. and is distributed out of Madison, South Dakota.

of Vitamin A.

Coyote Seeds is striving to give growers the benefits of that research by supplying the best of these alfalfas. In the pages that follow, you will find information on alfalfa varieties and blends available from Coyote Seeds.

# ALFALFA SEED BED SUGGESTIONS

A firm seedbed is one of the main requirements for stand establishment when planting alfalfa or grasses. A loose seedbed causes nothing but problems when starting alfalfa. A firm seedbed provides soil-to-seed contact to wick moisture and nutrients to the seed. The seedbed needs to be packed with a roller.

When planting warm-season grasses you should use a grassland drill or some kind of a drill that has an agitator in the seed box, because the seeds are fluffy and difficult to move through the drill.

A common way of seeding alfalfa is with an oats companion crop which decreases erosion while the alfalfa is getting established. The oats can be clipped for forage and the process does suppress weeds. A disadvantage of an oats cover crop is the competition the oats presents to the alfalfa seedlings for light, moisture and nutrients. The companion crop may preclude before harvesting alfalfa the seeding year.

# TRAVOIS ALFALFA

Travois has a low (decumbent) growth, aggressive root SD - NE - ORIGIN proliferation, winter hardiness, predominantly yellow Common Alfalfa is a winter hardy alfalfa grown variegated flowers and a large percentage of pickle and adapted in the state of origin, but is of an shaped seed pods. Its winter hardiness is superior to most unknown variety or varieties. It is usually not alfalfa varieties tested throughout our region. Plants of noted for high yields but is usually lower in price. Travois have the ability to produce stem buds on laterally spreading roots. Shoots from the stem buds emerge at the soi surface and develop into young plants at distances that sometimes exceed 36 inches from the mother plant. This characteristic permits a close association between A winter hardy alfalfa variety released by grass and legume, reduces trampling injury, thickens stand Wisconsin. It is wilt resistant and produces fine and decreases winter loss from soil heaving. stemmed, leafy quality hay.

ALFALFAS

The importance of alfalfa cannot be underestimated. It is considered the most outstanding forage plant due to its capacity for building soil fertility and furnishing large yields of high quality feed for livestock. Alfalfa hay rated highest in feed value of any of the common hay crops. It has a high protein and mineral content and as a supplier of calcium it is superior to any other forage crop. Alfalfa is an excellent source

# **COMMON** ALFALFA

ALFALFAS

# **MUSTANG** 425HD

### ALFALFA

Mustang 425HD is a high forage vielding, high forage quality HD<sup>®</sup> alfalfa variety. Mustang 425HD is protected by a broad spectrum of pest resistance package.

### **FEATURES:**

- Exceptionally high forage yield potential
- Outstanding forage quality attributes
- Solid disease resistance package

# **MUSTANG** 625APH2 ALFALFA

Mustang 625APH2 is a high forage yielding, good forage quality, sunken crown alfalfa with branch root tendencies, which allows it to be more productive in well and poorly drained soils. It was selected for resistance to multiple races of Aphanomyces root rot.

# **FEATURES:**

- Very high forage yield potential
- Resistance to Aphanomyces Race 1, 2 and isolates of Race 3
- Branch root trait
- Solid disease resistance package

# **MUSTANG** 620APH2

### ALFALFA

620APH2 is a product that is very resistant to the numerous races of Aphanomyces we are encountering in a variety of areas within the Midwest.

Yield and disease resistance are excellent (DRI score 30/30). 620APH2 is a super competitive variety that will work in our toughest field environments, as well as normal disease environments. Key placement is on all soil types throughout the Midwest. This product is very winter hardy and will work into a 3-5 cut system very well.

ALFALFAS

### MANAGEMENT PROFILE

• Selected for vield and persistence; its persistence is excellent under both normal and aggressive harvest

• Especially well-suited to areas where nematodes threaten vield production and reduce

• Offers producers broadspectrum pest resistance and excellent persistence; this high-yielding variety will keep producing quality hay for many

• Excellent salt tolerance • Dark green foliage and medium-fine stems make it

### **BROAD SPECTRUM** PEST RESISTENCE

• GA306SS offers producers broad-spectrum pest resistance and excellent persistence Resists Phytophthora and which can significantly reduce

production and stand life • Resistance to Fusarium Wilt, Anthracnose and moderate resistance to all major aphids

# **COYOTE 990**

ALFALFA

A special blend of alfalfa for upper Midwest with carefully selected viable pure seeds with high germination. Covote 990 has the ability to produce a lush stand quickly and produce for many years. Excellent production on good years and also will perform well on marginal ground and with limited rain fall. Seed is pre-inoculated — Apron<sup>®</sup> treated available.

Ratings are based on average performance of the variety over a wide range of climate and soil types. Actual performance may be adversely affected by extreme conditions. Unless stated, ratings are based on standardized testing procedures endorsed by the North American Alfalfa

# **MUSTANG S-8751BMR** CANE FORAGE

S-8751BMR is a medium early 95-100 day maturity 8-9 ft soft dough hybrid. Yield on dryland is great due to rapid growth. With wide leaves and quick growth this hybrid yields well.

# **MUSTANG S-8255BMR**

SORGHUM-SUDANGRASS HYBRID WITH BROWN MIDRIB

S-8255 may be used for direct grazing, hay or haylage. This hybrid is completely "Brown Midrib." It has significantly increased digestibility of its stems and leaves. This 6-8 foot tall sorghum offers the grower excellent quality and energy for his animals.

# **M20FS25 NEW!**

M20FS25 is a full season, sweet stalked, drought tolerant hybrid that produces high yields and good quality forage in 120 to 125 days.

# **MUSTANG S-8500** HYBRID PEARL MILLET

S-8500 offers excellent grazing and hay

potential.Fast re-growth after clipping. Clipping should be done in the pre-boot stage. Under good conditions hybrid is 5-6 feet tall in the pre-boot. Grazing should begin at approx. 25" tall.

# **BMR COYOTE GRAZE**

BMR Coyote Graze has a dry stalk trait which improves dry down time after cuttings. This improves harvestability and quality due to delays. You can expect 3-5% lower moisture in the boot state. BMR Coyote Graze is used for silage, baleage, hay and grazing. This hybrid is economical to plant, produces leading tonnage, and the overall forage quality is great. The digestibility is 20% greater than conventional. BMR sorghum increases animal intake and daily gains substantially. BMR Coyote Graze is grassy tillering more than other hybrids producing fine sweet soft stems.

# **COYOTE GRAZE**

Coyote Graze is an annual forage plant for silage, grazing, cover crop or green chopping. It has excellent early growth and grows very tall. The tonnage is extremely high and is very palatable. It can be planted either in rows, drilled or broadcast. Seeding should be at 10 to 12 pounds per acre in rows or 20 to 30 pounds per acre broadcast. It is very sweet juicy and leafy. The heavier the planting, the finer the stems will be. For pasture uses, a rotating system is suggested. Ideal grazing height is 24 to 36 inches. Normal grazing precautions should be observed. Before green chopping, the plants should reach a height of 24 to 36 inches. Usually Coyote Graze will yield 3 to 6 cuttings depending on planting time, moisture and temperatures. For hay, the plants should reach boot stage and ideally be followed by a conditioner after cutting. Recommended usage: silage crops where it is not practical to use corn, such as when circumstances require a fast-growing crop for late or delayed re-planting. Planting should be delayed until the soil is warm enough to germinate seed (60 to 70 degrees).

SORGHUMS & SEED FORAGES

# **48MC52 DT NEW!**

48MC52 DT is a cream grained very early maturity hybrid with a high yield potential. This hybrid is ideally suited for environments with shorter growing seasons and for double crop following wheat or other early harvested crops.

# **55MB59 DT NEW!**

55MB59 DT is a bronze grain early maturity hybrid with high yield potential. They hybrid is **Double Team** ideally suited for dryland acres in the Great plains where higher soil pH may be a problem. Can also be utilized as double crop in area with longer growing seasons.

# 54MC58 DT NEW!

54MC58 DT is a cream grained, early maturity hybrid with good drought tolerance and **Double Team** uniform appearance. Suitable for high pH soils, shorter growing season, and areas where double crop is planted following wheat or other early summer harvested crops.

# WG5963 HYBRID GRAIN SORGHUM

Is a medium-early hybrid with high yield potential, good drought tolerance and good standability. WG5963 is a Good Grade hybrid with cream colored grain and a tan plant.

# **GP5862 NEW!**

HYBRID GRAIN SORGHUM GP5862 is a medium-early maturity grain hybrid with high SCA tolerance. This hybrid has an excellent appearance with a semi-open head type and stiff stalk and staygreen traits to provide excellent drought stress tolerance. GP5862 is well adapted for dryland fields in the Great Plains with excellent yield potential.

# EH4852 HYBRID GRAIN SORGHUM

The earliest grain hybrid in the Mustang line. EH4852 has a good performance in the shorter growing areas of the sorghum belt in the High Plains and can be double cropped after wheat. EH4852 has excellent standability with good drought tolerance. Can also be planted later in the southern growing areas and is resistant to Biotype "E" greenbugs.

# **GP6466 NEW!**

HYBRID GRAIN SORGHUM GP6466 is a medium maturity hybrid that is well suited from the Great Plains south to Northeast Mexico because of its moderate White Sugarcane Aphid (SCA) tolerance and resistance to many leaf diseases. This bronze grain has an excellent appearance and is well-suited for dryland and irrigated fields.

**OTHER MILLETS & FORAGES ARE ALSO AVAILABLE** 

DT.TRAIT FirstAct.

**Double Team** 

DT.TRAIT FirstAct.

# WHEN SHOULD SORGHUMS & GRASSES BE HARVESTED?

### SILAGE

Forage Sorghums should be harvested at the middough stage for ensiling. At this point, quality is still good and most types have dried down enough for ensiling.

FORAGES

SEED

య

SORGHUMS

# HAY

Highest yields are obtained when sudangrass and sorghumsudangrass hybrids are harvested at the soft-dough stage. However, curing is difficult and quality is low when harvested this late. The general recommendation is to harvest either type for hay whenever forage is about 30 inches tall. Sorghumsudangrass hybrids are generally more difficult to make hay because of the larger stems. Crop should be cut 6 inches above the ground to encourage re-growth and two cuttings maybe expected.

### **GREEN CHOP**

Sudangrass and sorghum-sudangrass hybrids can be used to provide green chopped forage over summer. Begin chopping after the plant is 18 inches tall or cut at least 10 days after a killing frost to avoid prussic acid concerns. First cutting should be taken prior to heading.

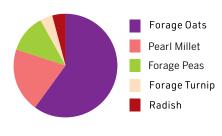

### PASTURE

Sudangrass and sorghum sudangrass hybrids can be grazed any time after the plant has reached a height of 18 inches, which is usually 5 to 6 weeks after planting. For best results, it should be grazed rotationally with a sufficiently heavy stocking rate to remove forage down to a 6 to 8 inch height in a few days. The pasture will grow rapidly when the cattle are removed for more total tonnage.

# MID-LATE SEASON **GRAZING MIX**

40 POUNDS PER ACRE Plant late spring for grazing as well as building soil health.

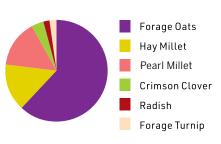

### **PLANT JUNE 1 - AUGUST 1**

### EARLY SEASON **GRAZING MIX**

40 POUNDS PER ACRE Can plant early in the spring for supplemental grazing. PLANT MAY 15 - JUNE 15

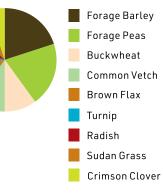

### **SOIL HEALTH PLUS MIX** 20 POUNDS PER ACRE

This mix is the real deal! Plant after small grain harvest, prevent plant acres or early corn silage acres. Will add nitrogen plus breakdown phosphorus for next year's crop. Will also add late season grazing, biomass and soil activity in alkali soils.

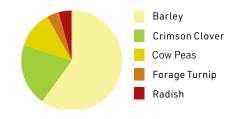

### PLANT JULY 15 - SEPTEMBER 15

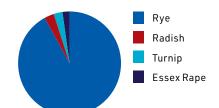

### SOIL BUILDER MIX 26 POUNDS PER ACRE

Will produce nitrogen and also scavenge nitrogen to help build soil health. The species in this mix should provide an earthworm haven and help establish growth in Alkaline soils.

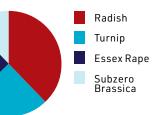

### PLANT JULY 15 - SEPTEMBER 5

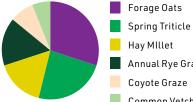

### FALL GRAZER MIX **59 POUNDS PER ACRE PLANT MID JULY - MID SEPTEMBER**

**BRASSICA PLUS** 8 POUNDS PER ACRE **PLANT MID JULY - MID SEPTEMBER** 

### SEASON LONG MIX 64 POUNDS PER ACRE PLANT APRIL - MAY

Annual Rye Grass Coyote Graze Common Vetch

**COVER CROPS + GRAZING MIXES** 

# WINTER PEAS

Winter peas are a leafy variety that produce excellent forage yields and standabillity. They provide excellent forage quality when chopped in combination with a small grain.

# SUBZERO BRASSICA

Brassica is a cross between kale and turnip. Improved forage quality and fast regrowth give forage brassica an advantage over common rapeseed.

# BUCKWHEAT

Can be harvested for grain or excellent for use as a cover crop.

# LADINO CLOVER

Ladino Clover is a giant white clover. The plants grow up to 14 inches high. Ladino recovers quickly from grazing or clipping, as new leaf and flower buds are continually developing on the running stems. Ladino has done best on medium to heavy soils with abundant moisture. It ranks high in feed value, is highly palatable and is a valuable soil improvement crop.

# RYE

Also called Winter Rye or Cereal Rye. Scavenger of excess nitrogen, prevents erosion, adds organic matter and suppress weeds. The hardiest of the cereal grains. Taller and quicker growing than wheat. Available in 3 varieties: Rymin, Dylan, Hazlet

# TRITICALE

There are fall and spring varieties. A cross between wheat and rye and is excellent for Fall/Spring Grazing or for a forage crop.

# **TEFF GRASS**

A self-pollinated, warm season annual grass which can be harvested multiple times during the growing season as dry hay, silage or pasture. As a fast-growing crop, Teff combines excellent forage quality with high yield during a relatively short growing season.

# **COMMON VETCH**

A nitrogen fixing leguminous plant. This hardy plant is often grown as green manure. It is tolerant of light mowing and will regrow in pastures after moderate

# **FORAGE BARLEY**

Forage Barley is a two-rowed hay barley that is well adapted for a wide variety of growing conditions and climates that produce a high yielding, high quality and uniform hay crop. Forage Barley has a fine stem which aids in feeding and digestibility.

# **GERMAN MILLET**

An annual grass with slim, vertical, leafy stems. It is a warm season crop that is planted in late spring. Harvest for hay or silage. Does not regrow.

# **ALSIKE CLOVER**

Popular in regions where red clover is the main rotation crop and areas where red clover will not thrive. It is used on low, wetland and soils that are low in lime content or have become run down. Alsike is suitable for either hay or pasture. It is especially valuable when used with Timothy and is usually used only in mixtures.

# MEDIUM RED CLOVER

A good nitrogen producer. Good root system-soil builder. Is a tall clover. Excellent for forage.

# **CRIMSON CLOVER**

With its rapid, robust growth, crimson clover provides early spring nitrogen for full-season crops. Rapid fall growth or summer growth in cool areas, also makes it a top choice for short-rotation niches as a weed suppressing green manure. Popular as a staple for age and roadside cover crop throughout the southeast, crimson clover is gaining increased recognition as a versatile summer-annual cover in colder regions.

# **BERSEEM CLOVER**

An annual pasture legume. Grows best on fertile, medium to heavy textured soils of mild acidity. It is a heavy nitrogen producer.

# MAMMOTH RED CLOVER

A short-lived perennial that produces only one cutting per season and is taller and much coarser than medium red clover. Lodging and leaf loss may be a problem if it is allowed to go to full bloom before cutting. Mammoth red clover requires less moisture than medium red but will perform better in poorer soils.

# YELLOW BLOSSOM

Sweet Clover Primarily used as a cover crop as it has deep roots that help break up compaction and build organic matter. Not a good forage crop.

# **BUSTER RADISH**

A late maturing cover crop radish that produces a significant root mass. This deep root system allows it to pull nitrogen and other nutrients from deep within the soil and bring them back.

# **DWARF ESSEX RAPE SEED**

A very popular, lower growing rape seed that is very nutritious to all classes of livestock. Dwarf Essex belongs to the cabbage family and has high protein and high energy levels. It is cold, heat, and drought tolerant and is a feed source during summer months when it is hot and dry.

# **PURPLE TOP TURNIPS**

Most commonly used turnip in the U.S. Works well for late fall and winter grazing. Good choice for low fertility soils.

# HAIRY VETCH

A winter hardy annual. It should be planted in late September or early October. The stems are weak and viny. When planted with oats and cut green it makes an excellent livestock feed. Hairy Vetch is used mainly as a green manure crop in the cotton belt.

# LENTILS

A member of the legume family. Lentils can supply a significant part of its nitrogen requirement by fixing nitrogen from the air. It is a cool season crop with a relatively shallow root. It is moderately resistant to high temps and drought. Lentils have an indeterminate growth habit. This cover crop will not tolerate waterlogged soils, flooding or high salts.

# FLAX

Is a brown-seeded, blue flowered variety. The variety is early in maturity and fairly tall.

# **ANNUAL RYEGRASS**

A very popular cover crop in parts of the Midwest. It is fast establishing, provides excellent weed suppression, can be grazed and helps to reduce nematode populations. Deep roots improve compaction, quick establishment and heavy top-growth to prevent soil erosion or runoff. Loves nitrogen, can uptake extensive amounts of phosphates.

# **FESTULOLIUM**

A hybrid cross between Meadow Fescue and Ryegrass. Festulolium is mainly utilized in pastures for grazing and stockpiling, either in mixes or pure stands. Benefits include higher forage yields than perennial ryegrass, increased mid-summer growth, high disease resistance and winter hardiness.

# **4010 FORAGE PEAS**

Is a cool season legume developed for the production of high-quality forage for livestock.

# **SUDANGRASS**

Fast growing with fine stems, aggressive tillering and a mass of leaves at harvest. Adapted to all areas. Can be used as pasture or for hay. Could have risk for prussic acid. Do not graze until 18" tall.

# SORGHUM SUDANGRASS

An intermediate plant size. It would be slightly taller than straight sudangrass. Yield is generally less than that for forage sorghums, but similar or slightly higher than sudangrass. It can be used for hay, greenchop, or pasture. Larger stems make drying for hay more difficult than for sudangrasses.

# FORAGE SORGHUM

Major use is for silage. Usually can grow between 8-13 feet tall. Stems and leaves are similar in size to corn. Feeding value of sorghum silage is 80-90% of comparable corn silage.

# **GRAIN SORGHUM**

Also called Milo, used for grain production. This type grows 3-5 feet tall depending on variety and growing conditions. It is usually not considered for forage production because of low dry matter yields.

### **CERTIFIED HAYDEN OATS**

A white-hulled, spring oat developed by the South Dakota Agricultural Experiment Station (SDAES) and released in 2015. Hayden has medium-late maturity, heading about 4 days later than Shelby 427. Hayden is 2 inches taller than Shelby 427 and 4 inches shorter than Goliath. Hayden has excellent yield potential and high-test weight. Hayden is resistant to smut and BYDV. The variety is moderately susceptible to crown rust and stem rust. Lodging resistance is better than Goliath and similar to Shelby 427.

# **CERTIFIED GOLIATH OATS**

A white-hulled, spring oat developed by the South Dakota Agricultural Experiment Station (SDAES) and released in 2012. The line was tested as SD090552 and was developed from the two-parent population IL99-1338/SD97575-38-154. Varieties in the pedigree include Rise, Settler and Troy. Goliath has late maturity, heading 1.7 days later than Stallion. Goliath is 4.3 inches taller than Stallion. Goliath has excellent grain yield and forage yield potential, as well as good test weight.

# **CERTIFIED SD BUFFALO OATS**

The South Dakota Agricultural Experiment Station is releasing a new white oat variety named SD Buffalo to Certified Seed growers in the spring of 2022. SD Buffalo is result from the cross SD08 1107//SD070394/ SD060130 and tested as SD150012. It is two days earlier than Rushmore in maturity, similar in plant height with superior straw strength, but slightly lower in test weight. SD Buffalo ranked 2nd in yield in CPT trials compared to all varieties from 2018-2021. It is moderately resistant to crown rust and the BYD virus and has good milling characteristics.

# **CERTIFIED DEON OATS**

Deon is a variety of oats developed and released by the Minnesota Agricultural Experiment Station (MAES) in 2012. Deon was selected from a cross Sesqui\*2/ Bettong//MN02108. Deon is a yellow seeded oat with medium large sized kernels. Deon has a late maturity. Deon is medium tall and has very high grain yield with medium test weight and medium groat and grain protein percentages. PVT protected.

# CERTIFIED WARRIOR OATS

Warrior oat is a white-hulled, spring oat developed by the South Dakota Agricultural Experiment Station (SDAES) and released in 2018. The line was tested as SD120419 with the pedigree of SD041405/ SD060130. Warrior is a medium maturing line, heading about 1 day later than Horsepower. Warrior is 2" taller than Horsepower. Warrior has high yield potential and average test weight. Warrior is moderately resistant to smut and moderately susceptible to BYDV. The variety is resistant to crown rust. Lodging resistance is excellent.

# **CERTIFIED RUSHMORE OATS**

White-hulled, spring oat developed by the South Dakota Agricultural Experiment Station (SDAES) and released in 2019. Pedigree of SD80015/ SD0070110/SD060130. Rushmore is a mediumlate maturing line, heading about 1 day earlier than Hayden. Similar in height to Hayden with better lodging resistance. Rushmore has highyield potential and good test weight. Resistant to moderately resistant to crown rust and moderately resistant to BYDV and smut.

# **JERRY OATS**

Jerry oats was developed by the North Dakota Agricultural Experiment Station and released in March of 1994. The line was tested as ND870952. **MUSTANG M-120 FORAGE OATS** The pedigree of Jerry is Valley/3/RL3038/Kelsey// It is a late maturing forage oat that has good leaf M22/ Kelsey. Jerry is similar to Newdak in heading rust resistance. M-120 oats is a high tonnage forage date and height and has good lodging resistance. oat that has out yielded Jerry and Loyal by tons per Jerry has white hulls, which are fluorescent under acre. It is a tall variety with a wide leaf for those extra UV light. Kernels have high test weight, groat tons per acre. percent and whole oat protein, but are not as high as Hytest in ND tests. Disease resistance ratings are moderately susceptible for barley yellow dwarf virus (BYD), smut and stem rust. Jerry is susceptible to crown rust. The variety has medium high protein.

OATS

# **MORTON OATS**

Morton oats was developed by the North Dakota Agricultural Experiment Station (NDAES) in cooperation with USDA and released in June 2001. The line was tested as ND941119 and resulted from the cross ND880922/IAB605X. Morton is mediumlate in maturity being similar to Troy and two days later than Jerry. The variety has high test weight with groat percent slightly higher than Jerry. Kernels are uniform and large in size with white hulls. Protein percent is similar to Jerry. Morton is a tall oat with good straw strength. The variety is resistant to smut. Morton is moderately resistant to stem rust, crown rust and is moderately susceptible to barley yellow dwarf virus (BYD). Morton is protected under the U.S. Plant Variety Protection Act (PVP-94).

# **COYOTE LAWN MIX**

4 TO 6 POUNDS PER 1000 SQ. FT.

Coyote lawn mix is a grass mixture that gives you a healthy, attractive lawnwith a combination of sun and shade tolerance. We have just enough fine leaf perennial ryegrass to get your lawn off to

a fast start. Kentucky bluegrass and creeping red fescue will continue to fill in and form a dense sod that will give you that quality appearance. This mix is recommended for all applications and will do especially well under intensive lawn practices.

# **ENDURANCE LAWN MIX** 8 TO 10 POUNDS PER 1000 SQ. FT.

Endurance lawn mix gives you exactly what the name says - a lawn

**70%** Fine Leaf Turf Type Tall Fescue 10% Kentucky Bluegrass

10% Fine Leaf Perennial Rye

33 1/3% Kentucky Bluegrass

33 1/3 Fine Leaf Perennial Rye

33 1/3% Creeping Red Fescue

60% Kentucky Bluegrass

15% Creeping Red Fescue

**25%** Fine Leaf Perennial Rye

that willendure. We have added enough perennial rye to give you 10% Creeping Red Fescue

that fast start, tallfescue to keep your lawn green when others have gone dormant and Kentucky bluegrass to help fill in and give you that dense full lawn. Tall fescue blades are slightly wider than perennial rye or Kentucky bluegrass but will blend in nicely if you keep the seeding rate at recommended levels. Tall fescue has a much deeper root system that keeps it green during drought stress, requiring less water and fertility. It will tolerate shade and is widely used for athletic areas. Endurance lawn mix should be planted in spring or very early fall to allow tall fescue to develop root system before winter.

# **THREE WAY LAWN MIX**

6 TO 7 POUNDS PER 1000 SQ. FT.

Economy lawn mix for those areas not requiring the higher quality Kentucky bluegrass. Perennial ryegrass establishes quickly with

creeping red fescue and Kentucky bluegrass completing the lawn. This mixture does well in sun and shady areas, but will create more thatch than either Premium Lawn or Endurance Lawn mixes.

**TURF GRASSES**

# MUSTANG REBOU **GRAZING MIX** 20-25 POUNDS PER ACRE

An excellent mixture of grasses to give you that and high yield production from every acre. mixture will give you early production wi forage perennial ryegrass. The Bromegra wheatgrass assure you full season production. This dual purpose mix may be used for hay or pasture use.

# **COYOTE HORSE PASTURE MIX** 20-25 POUNDS PER ACRE

Our hay and pasture mix is for those producers not wishing to have a legume in their mix. Forage perennial ryegrass, orchardgrass and Bromegrass assure rapid stand establishment and early season production. This is a highly palatable mix for grazing or having.

# **MUSTANG** THOROUGHBRED MIX **25 POUNDS PER ACRE**

This grass mix is especially suited for horses. Forage perennial ryegrass and orchardgrass give quick establishment and lush early season production. Together with timothy, forage bluegrass and ladino clover, your horse will have high protein and highly productive pasture throughout the entire season.

# **MUSTANG ORCHARD MIX 75 POUNDS PER ACRE**

This grass mix is a perfect mix for orchards. With crested wheatgrass and creeping red fescue, it will be a low grow mix with fine stems and have the ability to handle dry conditions.

PASTURE GRASSES

# SMOOTH BROMEGRASS

Smooth Bromegrass is a long-lived perennial sod forming grass that grows 2 to 4 feet tall. Smooth bromegrass spreads by creeping rhizomes and produces in the spring and late summer. Brome is one of the most productive, nutritious, and palatable forage grasses in the central and north central states. Bromegrass is a good soil builder when grown with legumes. It withstands hot, dry weather and has a long growing season. It is highly palatable, and all classes of livestock relish it.

# **RUSH INTERMEDIATE WHEATGRASS**

Rush, a variety of intermediate wheatgrass developed by USDA NFCS Plant Materials Center (Aberdeen, SD) from northern European germplasm for superior seedling emergence and vigor. Rush has equal to or superior forage production compared with other intermediate wheatgrass releases.

# **OAHE INTERMEDIATE WHEATGRASS**

Oahe was developed by South Dakota and is a large heavy seed. It is very leafy and yields higher than other intermediate wheatgrass varieties. Oahe Intermediate Wheatgrass is used later than bromegrass and is mainly used for hay and pasture.

# CRESTED WHEATGRASS

Crested Wheatgrass is fine stemmed and leafy. It is shorter than Standard Crested and is used extensively for turf in the drier areas.

# TIMOTHY

Timothy is valuable in pasture mixtures but is not suited for permanent pasture except in combination with other grasses and legumes. It is an ideal grass to plant with Alsike. Timothy is adapted to a considerable range of soil reactions but is adversely affected by high acidity to about the same degree as corn. As compared to clover or alfalfa hay, Timothy is relatively low in protein and also in minerals, especially calcium or lime. Timothy is a cool season short lived perennial bunch grass, is tall and late maturing.

# **ORCHARDGRASS**

Orchardgrass is a long-lived perennial bunch type grass. Orchardgrass recovers from grazing more rapidly than bromegrass and continues growth during mid-summer. This mid-summer growth helps in preventing bloat when mixed with alfalfas for pasture.

# FORAGE PERENNIAL RYEGRASS

Perennial ryegrass is a high yielding, high quality grass. Under grazing management, the best varieties are very persistent and nutritious. This grass is also very adaptable to all kinds of environment conditions including poorly drained soils. Perennial ryegrass is compatible in most mixtures with other grass species and clovers used as green chop and in pastures.

# **ANNUAL RYEGRASS**

A quick growing, non spreading bunch grass that has excellent forage values. Annual Ryegrass will also aid in holding soil with an extensive root system.

# **REED CANARYGRASS**

Reed Canarygrass is a tall, course, bigious, long live perennial that grows to a height of from 2 to 8 feet. It spreads by short, scaly underground rhizomes that form a heavy sod in well managed solid seedings. It is adapted for permanent pastures on poorly drained, wet areas. Reed Canarygrass is very tolerant to flooding, even for several weeks duration. It can be used for pasture, hay or silage. Hay quality may be improved by early spring pasturing to delay maturity, thus reducing the coarseness of the growth. Although this grass grows best on moist, cool sights, it makes excellent growth on upland soils. One of the earliest grasses to begin growth in the spring, it produces large yields of nutritious forage. Reed Canary is an excellent waterway grass because of its tolerance to waterlogged situations and should be considered a first choice under these conditions.

# FAWN TALL FESCUE

Fawn Tall Fescue is an early maturing variety adapted to the central and northwest states. It has good seedling vigor, good palatability and great forage production.

# **ALKAR TALL WHEATGRASS**

Alkar Tall Wheatgrass is a hardy, drought resistant perennial bunch type grass with coarse foliage. It is quite palatable and easy to establish. It is also quite alkali tolerant and best adapted to low marshy and highwater table areas.

# **MEADOW BROMEGRASS**

A cool season, long lived perennial, sod-former with short rhizomes. Adapted to most sites, but performs best on moderately deep, well-drained moist soils. Provides excellent forage and is often used in blends with legumes and other grasses because of its ability to survive but not compete with them.

# **TEFF GRASS**

A self-pollinated, warm season annual grass which can be harvested multiple times during the growing season as dry hay, silage or pasture. As a fast-growing crop, Teff combines excellent forage guality with high yield during a relatively short growing season.

**PASTURE GRASSES** 

17

# WARM SEASON GRASSES

A plant that makes most of its growth during the spring and summer flowering in the summer or autumn.

# SWITCHGRASS

Switchgrass is a warm season perennial that grows to a height of 2 to 5 feet, although bunch like in appearance. Switchgrass has strong rhizomes that produce a coarse sod, particularly if grazed. It prefers area where moisture is abundant and can stand flooding for short periods and is used in water ways. This grass exhibits rapid growth in late spring and early summer and is readily grazed by cattle, horses and sheep. It is high yielding and produces best if cut early. Newer varieties of this grass are Nebraska 28, Forestburg and Sunburst.

### LITTLE BLUESTEM

Little Bluestem is a warm season, leafy perennial bunch grass which grows to a height of 1 to 4 feet. It can be grazed and has food forage value when the leaves are tender and succulent. It does not cure well and has only moderate palatability for fall or winter grazing.

# SIDE OATS GRAMA

Side Oats Grama is a warm season, erect native perennial grass which grows in tufts and open bunches to a height of 1 to 2 feet tall. It is more tolerant to drought than Indiangrass or Big Bluegrass. It grows fast in late spring and early summer and stays green late into the summer. Side Oats Grama has good forage value and is grazed mostly in late summer and fall. Improved varieties are Butte, Tailway and Pierre.

# **BLUE GRAMA**

Blue Grama is short growing native warm season perennial bunch grass. It is found mostly in the western Dakotas and Nebraska and withstands heavy grazing. It has high drought tolerance on all types of soil. This grass can be grazed in late summer, fall or winter. Blue Grama is used for lawns in drier areas in mixtures with Buffalograss.

# **BIG BLUESTEM**

Big Bluestem is a warm season perennial bunch grass which grows to a height of 3 to 8 feet. It has roots that permeate the top 2 feet of soil. Big Bluestem is adapted to moist, deep, well drained soils. It is very palatable and nutritious. Big Bluestem that is continuously grazed closer than 6 to 8 inches will be replaced by less desirable grasses. Some of the better varieties are Bonilla, Bison, Pawnee and Roundtree.

# **COOL SEASON GRASSES**

A plant that makes most of its growth and flowers during spring and slows growth or becomes dormant during the hot part of the summer, and may resume growth in the fall with the advent of cool temperatures.

# INDIANGRASS

Indiangrass is a warm season grass that spreads by seed and short rhizomes. It grows to a height of 3 to 6 feet and will grow on sandy soil, however it is better adapted to moist, well drained bottom lands. Indiangrass exhibits moderate salt tolerance and will withstand occasional flooding. It makes good quality hay if cut before flower stalks develop. Improved varieties of Indiangrass are Holt and Tomahawk.

# BUFFALOGRASS

Buffalograss is a fine leaved, native, sod forming, warm season perennial and is very low growing. It has leaves that are from 4 to 8 inches long. It makes rapid growth in late spring and summer. It recovers rapidly after a drought and can withstand heavy grazing. Buffalograss does a good job of erosion control and is used in lawns for drier areas and for airport runways, picnic areas, etc.

# **GREEN NEEDLE GRASS**

Green Needle Grass is a cool season, perennial bunch type grass that grows from 1-1/2 to 3 feet tall. It is a native grass that grows on medium to fine textured soil. Green Needle Grass starts growth early in the spring, is nutritious and palatable and remains green through the summer, except in very dry years. It has good regrowth in the fall and is grazed throughout the year. Stand establishment may be slow because of slow germination, caused in part to a high dormant seed content.

# WESTERN WHEATGRASS

Western Wheatgrass is a native, cool season perennial, sod forming grass which reproduces from underground rhizomes and seeds. Western Wheatgrass spreads rapidly and forms a dense sod, making it valuable for erosion control. It produces an abundance of forage early in the season that is nutritious and readily eaten by livestock until late summer when it becomes harsh and fibrous. It makes a good quality hay if cut during the late bloom stand and can stand close grazing. Western Wheatgrass will do well on a wide range of soils, from sands to clay. It is very tolerant to alkali. This grass can be seeded in pure stands but is usually used in mixtures because it provides ground cover auite slowly.

# **GARRISON CREEPING FOXTAIL**

Garrison Creeping Foxtail is a long lived, cool season, sod forming grass. It is adapted to wet soils, sub-irrigated sites or high mountain meadows. It can be used in mixtures on irrigated pastures. This grass grows fast in hot or cool weather, and forage production is very high, palatable, nutritious and relished by all classes of livestock. Garrison Creeping Foxtail is recommended for use in pasture mixes with other adaptable grasses.

# **CANADA WILD RYE**

Canada wildrye is a short-lived, cool-season grass found on sandy shores and dunes; wooded areas, especially along trails, rivers and streams; and other disturbed sites throughout much of North America. Seedlings are vigorous and establish quickly, but g are not highly competitive with other grasses. Growth begins later in the spring and lasts longer into the summer than growth of smooth brome. It  $\overset{\circ}{\aleph}$ is moderately drought tolerant and winter hardy. It has good tolerance to salinity and tolerates shade very well.

**NILDLIF** 

# **ANTLER CHICORY**

Chicory is an herb and develops a rather deep tap-root that prefers loamy, well-drained soils. While chicory was originally used as a coffee substitute, it has now become a dynamic tool in food plots for land managers. For a change of pace, try growing chicory, a tough cool-season perennial crop that is a preferred deer forage, in your next fall food plot.

# WGF **OPEN POLLINATED SORGHUM** WILD GAME FOOD USAGE

Wild Game Food is an early-maturing sorghum that is 24-34 inchesin height. The seed becomes palatable at maturity and is readily consumed by quail, turkey, pheasant, prairie chicken, as well as migratory birds and deer. Mid-bloom 43 to 50 days. Mature seed 85 to 100 days.

# PURE LIVE SEED (PLS)

A purity of 99.50 x a germination of 90% = 99.50 x .90 = 89.55 PLS

100 lbs. of this seed would contain 89.55 lbs.. of pure live seed. If needed 80 PLS lbs. you would need 89.34 bulk lbs. (80.00/89.55)

# NITRATE AND PRUSSIC ACID POISONING

Plant nitrate poisoning in ruminants usually occurs as Prussic acid poisoning symptoms are very similar to a result of consuming forages of high nitrite or nitrate those of nitrate poisoning. The most important cause of content. Some plants have a tendency to exhibit high prussic acid poisoning among domestic animals is the nitrate content and others under certain conditions, ingestion of such plants as arrowgrass, johnsongrass,

have the ability to accumulate large quantities of nitrates. Toxic levels of nitrate are sometimes found in common pasture grasses, especially during rapid growth at high rates of nitrogen fertility.

Corn grown under droughty conditions may concentrate nitrates in the base of the stalk. However, most losses occur in the Great Plains states when oats, barley or wheat are fed after a recent rain.

rapidly developing plants contain greater quantities A variety of common weeds growing on marsh or of these glycosides. Spraying of these plants with muck soils, which have high nitrogen and relatively low herbicides may also increase the toxic hazard. phosphorus and potassium content, can cause nitrate poisoning problems in livestock. Low temperatures, Grazing plants such as sorghums should be avoided limited sunlight, poor mineral sources and application during periods of early growth (under 18 inches) or directly after a frost. New growth after a frost should be of plant hormone type herbicides can also contribute to increased nitrate Levels. Other causes and aggravating avoided, as concentrations may be high. There is little conditions may be shallow wells and nitrate type danger from feeding well cured hay. The risk of prussic fertilizers where animals feed. Animals fed a high ratio acid poisoning may be decreased by feeding of ground of high energy grain feed are better able to withstand cereal grains or other feed before animals are turned high nitrate levels in forage. out to graze.

21

sudangrass, common sorghum or sorghum sudan hybrids, several berry type plants and flax. These plants contain cyanogenetic glycosides which, when acted upon by digestive enzymes, yield prussic acid. These conditions can also be aggravated by heavy nitrogen fertilization, wifting, trampling and plant diseases. Very young,

# SEED PLANTING RATE GUIDE

# **Herbicide Rotational Restrictions** FOR COVER AND FORAGE CROPPING SYSTEMS

Daniel H. Smith, Richard Proost, Nutrient and Pest Management Program; Maxwel Coura Oliveira, Ryan Dewerff and Rodrigo Werle, Department of Agronomy; University of Wisconsin-Madison

This publication provides a starting point of reference when considering using cover crops following herbicides in the cropping system. This publication does not replace the herbicide label. This publication outlines rotational intervals for many commonly used herbicides in Wisconsin. The rotational interval is the required amount of time from herbicide application to subsequent crop establishment for forage or harvest value. For example, a herbicide is applied to soybeans with a 10-month rotational interval for winter cereal rye. The rye could be established 10 months after the herbicide application for food or feed value. This rotational interval is legally required period prior to crop harvest for feed or forage. Cover crops intended for forage value must follow the rotation interval. Cover crops utilized for soil building do not need to follow the rotational interval, however, they may still be prone to herbicide injury. This herbicide injury is often attributed to herbicide carryover and the chances of injury can be better understood after a field bioassay. The herbicide label must be referenced prior to making any management decisions. The rotational intervals stated in this publication are the maximum rotational restriction taken from the most current herbicide label available at time of printing.

### Herbicide Carryover

For cover crops to accomplish their intended goals, they must establish well; establishment of cover crops can be compromised by use of residual herbicides, the herbicide activity in the soil for a period of time after application and are applied to the preceding cash crop. The persistence of these residual herbicides may affect cover crop establishment later in the growing season and can be affected by a wide range of management (tillage, application rate, and herbicide application method) and soil properties (moisture, temperature, soil colloid properties, chemical reactions, pH, microbial population, soil texture and organic matter) (Krausz et al., 1992). Cover cropping and using residual herbicides is not impossible but is challenging. Herbicide resistant weed management should be considered when planning herbicide applications. The cost of herbicide program, cover crop benefits, and resistance management should all be considered.

### **Cover Crop vs. Forage Crop**

A crop is classified as a cover crop when no forage or grain biomass is harvested. A cover crop is established for benefits to the soil, cropping system, and environment. A cover crop becomes a forage crop when biomass is harvested for feed. This includes harvesting the crop via grazing or mechanical collection. A cover crop can be used for forage; however, most pesticide labels do not provide the plant back restriction time required from pesticide application to grazing or harvest for cover crops, only forage crops. Therefore, requiring the maximum rotational restrictions be utilized. If these restrictions are not followed, harvesting a cover crop for forage value is illegal. Crop rotation restrictions will vary in length and should be examined for all pesticides and crops in the rotation. A cover crop that will not be harvested for any value can be legally established following any herbicide application, however, the grower takes all responsibility for cover crop injury or failure that may result. Several herbicide labels provide guidance for using cover crop following application. A bioassay is often recommended to evaluate herbicide injury potential.

# Winter Cereal Rye Termination for Forage Systems

Winter cereal rye is often harvested as forage and questions arise when the rye should be terminated prior to the subsequent crop. Pre-harvest termination treatment is often illegal. Harvesting winter rye without another termination treatment is effective at reducing biomass and slowing regrowth, however, a second termination method is often required. Chemical treatment of rye regrowth, which may include residual herbicides for the following crop, should accommodate the pre-harvest interval, plant back restrictions for the subsequent crop and not have an antagonistic effect on the rye termination. Post-harvest glyphosate treatments are effective and legal methods of terming winter rye, and these applications can occur immediately following harvest with no reduction in efficacy.

### **Bioassay**

# When using these data tables use these ground rules:

- 2. This data is intended to be an introduction to herbicide rotational intervals; always consult the label before making management decisions.
- 3. Maximum rotation length is shown; rotation length is often dependent upon herbicide application rate, tillage, soil type, and yearly rainfall.
- 4. The data is formulated for Wisconsin producers and utilizes rotational data for areas that receive +30 inches of precipitation per year.
- 5. Some herbicide rotations do not consider frozen soils to count towards the minimum rotation interval; consult the label to clarify this information.

A field bioassay is often required or recommended prior to establishing crops following residual herbicides. A bioassay is a test that measures the effects of residual herbicides in the soil on a crop in a controlled trial. Herbicide residues may vary in strength and be variable thought the field depending management and environmental conditions. A few variables include soil texture, pH, and drainage. A bioassay should be done using the typical management practices for the crop to be planted following herbicide application.

Two types of bioassay may be recommended. The most common, field bioassay, is done by using a small area of the field to plant a small trial area of the intended crop. This crop should be monitored for injury symptoms, stand reductions, reduced biomass/grain production. If injury occurs, extend the rotational interval to the next growing season. If the cover crop planted is for soil building and will not be harvested, a small tolerance for injury may be acceptable.

The second type of bioassay is done in a controlled setting. This includes collecting a small amount of treated soil from the field and placing in pots. These pots should be in a controlled environment (near a window and heated indoor area). The intended crop should be planted in these pots and observed for herbicide injury. More info can be found here "A Quick Test for Herbicide Carry-over in the Soil" Klein et al. 2008. A bioassay does not replace the rotational interval.

# **Crop Variety and Hybrid Sensitivity to Herbicides**

The data presented in this publication shows the rotational cropping intervals for common Wisconsin forage, grain and cover crops. Hybrids and varieties make a difference in herbicide tolerance. Genetic engineering allows crops traditionally injured by some herbicides to allow over the top applications and limited plant back restrictions. Always understand what traits and tolerances are in being used in your cropping system.

1. Always read, follow, and understand the herbicide label. The label is the law.

The product information compiled here is intended to be as accurate as possible at the time of printing. Refer to product label for more detailed restriction information. Always follow the product's current label

restrictions and instructions.

Restrictions assume cover crop planted in summer/fall shown in months; the most restrictive data is shown.

ACH=after crop harvest; D=days; FY= full year (365 days) after application M=months; NL= not listed;

0= typically a labeled crop with no rotational restriction interval

The product information compiled here is intended to be as accurate as possible at the time of printing. Refer to product label for more detailed restriction information. Always follow the product's current label

restrictions and instructions.

### Restrictions assume cover crop planted in summer/fall shown in months; the most restrictive data is shown.

0= typically a labeled crop with no rotational restriction interval

### The product information compiled here is intended to be as accurate as possible at the time of printing. Refer to product label

for more detailed restriction information. Always follow the product's current label restrictions and instructions.

The product information compiled here is intended to be as accurate as possible at the time of printing. Refer to product label for more detailed restriction information. Always follow the product's current label restrictions and instructions.

Restrictions assume cover crop planted in summer/fall shown in months; the most restrictive data is shown.

ACH=after crop harvest; D=days; FY= full year (365 days) after application M=months; NL= not listed; 0= typically a labeled crop with no rotational restriction interval

# WHY YOU SHOULD BUY COYOTE SEEDS

- We use seed varieties that have their origins from our growing area.
- Our quality is reflected by our buying and growing process. We reject all seed that doesn't meet our quality standards.
- We use only local growers that are certified seed producers and have the knowledge of seed production.
- Our cleaning plant has experienced personal that have the desire to deliver a superior product to our customers.

When you buy coyote seeds you are buying from a local family owned business that was started in 1942. Times have changed but our way of doing business has not. We will provide quality seed at a competitive price with pride.

The factors contributing to Coyote Seeds quality include: up-to-date modern conditioning equipment; adapted origins and varieties; selective buying for quality; and experienced personnel who have the desire to give you a superior product. The result is bright, plump seed of high purity and germination, free from noxious weeds.

NOTICE: Coyote Seeds, a division of Mustang Seeds, hereby gives notice that any statements or descriptions on the bag or tag are informational only, and not made or given as a warranty of the product in any way; that said product is sold without any warranties, expressed or implied of MERCHANTABILITY or FITNESS of the seed for any particular purpose; nor any other warranty against loss of yield due to any cause, including environmental conditions, disease, insects, soil conditions, chemicals, farming practices or the response of this seed to any such conditions.

Purchaser shall be solely responsible for determining the adequacy of the product for any and all uses to which the purchaser shall apply the product, and the application of the product by purchaser shall not be subject to any implied warranty of fitness for that purpose. Sale subject to arbitration where applicable.
